#### **1 INTRODUCTION**

This document on the key learning area of Mathematics Education is written in support of the consultation document *Learning to Learn* prepared by the Curriculum Development Council (Nov 2000) and should be read together with it. The *Learning to Learn* document is the outcome of the Holistic Review of the School Curriculum conducted by CDC beginning in 1999, which is done in parallel with the Education Commission's Education System Review.

#### **2 BACKGROUND**

- 2.1 Students require knowledge and skills that will help them compete in the society of the 21<sup>st</sup> century, which is an information age. To reflect the rapid growth of knowledge in the information age, mathematics has unquestionably become a necessity for every individual to contribute towards the prosperity of the society. Mathematics pervades all aspects of life and it would be very difficult to live a normal life without making use of mathematics of some kind. Many of the developments and decisions made in industry and commerce, the provision of social and community services as well as government policy and planning etc., rely to some extent on the use of mathematics.
- 2.2 Mathematics is essential in the school curriculum of Hong Kong as it is:
  - a powerful means of communication It can be used to present information in many ways like figures, tables, charts, graphs and symbols, which can be further manipulated to deduce further information.
  - an analyzing tool for studying other disciplines It helps students enhance their understanding of the world.
  - an intellectual endeavour and a mode of thinking It is a creative activity in which students can be fully involved and display their imagination, initiative and flexibility of mind.
  - a discipline, which can develop students' abilities to appreciate the beauty of nature, think logically and make sound judgement – These mathematical experiences acquired in schools enable students to become mathematically literate citizens and contribute towards the prosperity of the society.

Mathematics is valuable to help students develop the core competencies for lifelong learning. It is an integral part of the general education and hence a key learning area (KLA) of the school curriculum of Hong Kong.

#### **3 RATIONALE FOR DEVELOPMENT**

- 3.1 The CDC Committee on Mathematics Education holds the following views:
  - High technology like computers and calculators has profoundly changed the world of mathematics education. Students should master information technology to become more adaptive to the dynamically changing environment. Mechanical drilling and impractical topics are no longer essential and relevant in mathematics learning.
  - It is important for our students to gain experience and acquire foundation knowledge and skills, develop capabilities to learn how to learn, think logically and creatively, develop and use knowledge, analyze and solve problems, access and process information, make sound judgements and communicate with others effectively.
  - Students should be able to build up confidence and positive attitudes towards mathematics learning, to value mathematics and to appreciate the beauty of mathematics.
- 3.2 According to two research studies<sup>1</sup>, which were conducted in 1998 for supporting a holistic review<sup>2</sup> of the Hong Kong mathematics curriculum, although the current mathematics curriculum is well supported by various stakeholders, there are problems which should be resolved for improvement: The existing school mathematics curriculum is generally contentoriented<sup>3</sup>, rather packed and difficult. The mathematics curriculum at S.1 repeats some of the material at P.5 and 6. Some of the content areas in Additional Mathematics overlap

<sup>&</sup>lt;sup>1</sup> The two research studies were Comparative Studies of the Mathematics Curricula of Major Asian and Western Countries and An Analysis of the Views of Various Sectors on the Mathematics Curriculum. The former was conducted by The University of Hong Kong while the latter The Chinese University of Hong Kong. The two research studies were completed with reports compiled in mid-1999. Summaries of the findings are listed in Appendix 1 and the reports can be found from the web site www.cdccdi.hk.linkage.net/cdi/maths/ index.htm.

<sup>&</sup>lt;sup>2</sup> The holistic review was carried out by an Ad hoc Committee, which was set up in July 1997 by the former CDC. The chairman was Dr Wong King-keung who was a member of the Hong Kong Airport Authority. The final report of the Ad hoc Committee had been issued to schools in June 2000 and can be found from the web site www.cdccdi.hk.linkage.net/cdi/ maths/index.htm.

<sup>&</sup>lt;sup>3</sup> The term "content" used in this consultative document means "knowledge objectives" unless otherwise stated.

with those of Secondary Mathematics (1985), AS-level Mathematics & Statistics and A-level Pure Mathematics. Such redundancy has brought difficulties to teachers teaching these subjects and generated an unnecessary inclination among students to take Additional Mathematics even if they do not have the competence. Moreover, the similarity between A-level and AS-level Applied Mathematics, the lengthiness of A-level Pure Mathematics and the unclear target students of AS-level Mathematics & Statistics have drawn grievances from the school teachers.

3.3 Teaching at the senior primary, senior secondary and sixth form levels is examination-driven. Most teachers and students only focus on the teaching and learning of those materials which are included in the examination syllabuses. Mathematical knowledge which can arouse students' interest is seldom introduced if it is beyond the examination syllabuses. The scope of learning is therefore confined.

#### **4 PHASES OF DEVELOPMENT**

#### 4.1 Short-term (2000 – 2005)

- 4.1.1 Both the primary and secondary mathematics curricula have been revised with the aim of shifting the emphasis of students from rote procedures and meaningless drilling to the development of their thinking abilities, catering for the different needs and abilities of students and strengthening their learning. In terms of content, the revised primary and secondary mathematics curricula have been trimmed down by about 15% and 11% respectively. If necessary, schools/teachers could further adapt the curricula to create more space for
  - using IT in mathematics teaching/learning;
  - conducting project learning;
  - doing exploratory work;
  - organizing consolidation/enrichment activities, etc.
- 4.1.2 Tryouts of some selected topics (see Appendix 2 for the list of tryout topics/teaching strategies) in some schools have been conducted since 1997. The results of the tryouts and the comments and suggestions from the schools concerned, teachers' opinions from related surveys and seminars, and the recommendations of the Ad hoc Committee were adequately considered before the finalization of the revised curricula. The revised secondary mathematics curriculum<sup>4</sup> will be implemented at S.1 in September 2001 and the primary one<sup>5</sup> at P.1 in September 2002.
- 4.1.3 The Education Department will organize relevant inservice training programs to familarize teachers with the focuses of the revised curricula. Reference materials including exemplars, useful web sites and CD Roms will also be produced.

<sup>&</sup>lt;sup>4</sup> The curriculum document *Syllabuses for Secondary Schools: Mathematics (Secondary 1-5)* (1999) was issued to secondary schools in March 2000.

<sup>&</sup>lt;sup>5</sup> The curriculum document *Syllabuses for Primary Schools: Mathematics (Primary 1-6) (2000) (Second Draft)* has been endorsed by CDCC on Mathematics Education and will be issued to primary schools in April/May 2001.

#### 4.2 Medium-term (2005 – 2010)

To reduce the effect of overlapping between Additional Mathematics and the related mathematics subjects at the sixth form levels, the curriculum of Additional Mathematics will be revised in the near future.

#### 4.3 Long-term (2010+)

In the long term, pending the review of the new senior secondary structure, the sixth form mathematics curriculum will be restructured to cope with the revised primary and secondary mathematics curricula, to ensure better continuity among various mathematics subjects and to suit the diversified needs of students.

#### 5 THE FRAMEWORK

#### 5.1 Overall Aims

The aims of mathematics education are to develop:

- our youngsters' knowledge, skills and concepts of mathematics and to enhance their confidence and interest in mathematics, so that they can master mathematics effectively and are able to formulate and solve problems from a mathematical perspective; and
- their thinking abilities and positive attitudes towards learning mathematics and build related generic skills<sup>6</sup> throughout their life time.

#### 5.2 Learning Targets

Both learning processes and content of mathematics are important in mathematics learning and hence reflected in the learning targets of the mathematics curriculum. Details of the learning targets in the four key stages can be found in Appendix 3.

#### 5.3 Components of the Framework

Diagrammatic Representation of the Framework of the Mathematics Curriculum

In general, the framework of the mathematics curriculum can be represented diagrammatically as shown in Figure 1 on page 9.

<sup>&</sup>lt;sup>6</sup> The 9 essential generic skills identified are collaboration skills, communication skills, creativity, critical thinking skills, information technology skills, numeracy skills, problem solving skills, self management skills and study skills (see Appendix 4 for details).

It can be seen from Figure 1 that the essential learning experiences for achieving the aims of mathematics education are organized into 5 learning dimensions at the primary level and 3 at the secondary.

#### <u>Primary</u>

<u>Secondary</u>

- Number & Algebra
- Measures, Shape & Space
- Data Handling

Algebra

• Number

- Measures
- Shape & Space
- Data Handling

The learning dimensions are merged from 5 dimensions to 3 because less emphasis will be put on the Number and Measures dimensions at the secondary level. Moreover, it is not easy to include certain learning areas in one single dimension in Key Stages 3 and 4. For example, trigonometry involves measures of angles and lengths as well as spatial concepts. Similarly, problem-solving strategies usually interweave at the higher level and it is not easy to solve problems by using only numerical or algebraic approach.

On the other hand, since students use mathematics to a different extent as they move along the grade levels, the use of dimensions will not be extended to the sixth form mathematics curriculum.

<sup>&</sup>lt;sup>7</sup> The term "learning dimension" has been used in the revised primary and secondary school mathematics syllabuses.

#### Diagrammatic Representation of the Framework of the Mathematics Curriculum

Figure 1

#### 5.3.2 Generic Skills, Values & Attitudes

Daily life applications and high-order thinking skills (HOTs) are emphasized in the recently revised primary and secondary mathematics curricula. At the same time, as we live in a knowledge-based society in which many social policies and practices are shaped by statistically manipulated data, the mastering of generic skills and the fostering of positive values and attitudes should also be stressed. They are expected to develop/be fostered through the learning of mathematical knowledge in the content areas and it is desirable for teachers to help students cultivate these learning elements through planned learning activities. Figure 2 illustrates how these learning elements intertwine to form a reference grid.

![](_page_11_Figure_1.jpeg)

Figure 2

The list of generic skills, which are regarded as paramount for lifelong learning in a world where knowledge is ever changing, is attached in Appendix 4. Examples showing how the skills can be experienced through the course of mathematics learning are provided. Similarly, related values and attitudes which are expected to be developed throughout the mathematics course at various stages of the Mathematics Education are shown in Appendix 5. Appendix 6 gives six detailed exemplars which illustrate how the learning targets and generic skills can be linked. Exemplars 1 to 3 are at the primary level and exemplars 4 to 6 at the secondary level. The linkage between the exemplars and the main learning targets and generic skills is summarized in the following table.

| 1"To understand whole<br>numbers" of the Number<br>Dimension in Key Stage 1critical thinking<br>problem solving2"To group and make 3-<br>dimensional shapes" of the Shape<br>& Space Dimension in Key Stage 2communication2"To formulate and solve problems<br>arising from collected data and<br>constructed graphs" of the Data<br>Handling Dimension in Key Stage<br>2collaboration<br>critical thinking<br>problem solving3"To interpret simple algebraic<br>relations from numerical, symbolic<br>and graphical perspectives" of the<br>Number and Algebra Dimension<br>in Key Stage 3information<br>technology4"To investigate and describe<br>relationships between quantities<br>using algebraic symbols and<br>relations" of the Number and<br>Algebra Dimension in Key Stage 4information<br>technology  | Exemplar | Main learning targets linked       | Main generic skills linked            |

|  |          |                                    |                                       |
| т<br>т   |          | 4                                  |                                       |

Schools could develop their own school-based mathematics curriculum along the same line as the framework with reference to the detailed set of learning objectives provided in the two recently revised Syllabuses.

#### 5.4 Modes of Curriculum Planning

- 5.4.1 The principle of proposing different modes of curriculum planning is to build on strength of schools and teachers, and provide them with curriculum flexibility and diversity to meet different purposes of teaching/learning. At the primary and secondary levels, the curricula are planned by objectives and a "dimension approach" is adopted. Although the dimensions are content-based, the high-order thinking skills, generic skills, values and attitudes are expected to be incorporated into the content (see Figure 2) during teaching.
- 5.4.2 Enrichment activities/topics are provided in the revised primary mathematics curriculum, while the foundation part, non-foundation part and enrichment activities/topics are provided in the revised secondary mathematics curriculum to suit the different abilities of students.
- 5.4.3 Spare periods are also reserved at each key stage to provide teachers with curriculum space to rearrange or to adapt the content and depth of the teaching materials, using IT in mathematics teaching/learning and organize exploratory activities. Teachers have the flexibility to design their school-based mathematics curriculum to suit the needs of their students. However, it is not desirable to utilize the spare periods to do unnecessary drilling.

#### 5.5 Teaching, Learning and Assessment

5.5.1 To take better account of the changing needs of the community, the main focus of the revised primary and secondary mathematics curricula is not on what mathematical topics should be learnt but on how mathematics is learnt. Therefore, the acquisition of high-order thinking skills and generic skills and the fostering of positive attitude towards mathematics learning are strongly advocated and should be allied with the learning of mathematical content. The teachers' role should be to facilitate students to learn how to learn through using the said skills in mathematics.

- 5.5.2 Teaching strategies should be progressively changed through different levels of schooling, say from concrete to abstract, so as to cope with students' development. A thematic approach is encouraged at junior primary levels. Similarly, investigational work is encouraged at all the primary levels and should be continued in secondary schools. The teaching of abstract mathematical ideas should be supported by students' concrete experiences at earlier stages as far as possible. This is because students need time to play around with concrete objects before proceeding to more abstract notions at the senior level. On the whole, exposure to concrete objects and gaining personal experiences are important and should therefore be planned and built into the teaching programme as much as possible to support discussion in the mathematics curriculum.
- 5.5.3 Diversified teaching/learning activities including projects are encouraged. The application of mathematical concepts receive greater attention as it provides students with motivation for learning mathematics and experiences in using mathematical models. Therefore, daily-life situations are suggested as the means to help students realize the need for mathematics and its applications. In the revised secondary mathematics curriculum, further applications of mathematical knowledge in more complex real-life situations, which require students to integrate their knowledge and skills from various disciplines to solve problems, are provided through the new module "Further Applications".
- 5.5.4 Since each student has his/her own strengths and weaknesses, the mathematics curriculum can be duly adjusted across different levels of learning to cater for the different abilities of students. The structures of the recently revised primary and secondary mathematics curriculum give teachers adequate flexibility to cater for the effects of learner differences. As well as the adaptation of the curriculum, information technology, diversified teaching approaches, remedial teaching, etc. can also be adopted. It is up to teachers' discretion to revisit some topics when needed. However, it should be noted that though the spiral approach has its strong points,

teaching too many topics in a single year and making learning fragmented should be avoided. In addition, measures like organizing bridging programmes can be taken to ensure that students of different abilities can follow. In the process of developing the school-based curriculum, a flowchart indicating the inter-relation of topics at different levels is highly desirable to ensure continuity. The flowcharts attached in *Syllabuses for Primary Schools: Mathematics (Primary 1-6) (2000)* and *Syllabuses for Secondary Schools: Mathematics (Secondary 1-5)* (1999) can be referred to.

- 5.5.5 Apart from the formal mathematics curriculum. mathematics-related activities also play an important role in mathematics learning. It is generally agreed that well chosen and organized mathematics-related activities help to promote students' interest in learning the subject. mathematical Examples include games/puzzles, mathematics mathematics competitions/quizzes, workshops, projects, talks, plays, film shows, mathematics bulletins, newspaper cutting and board displays, etc.
- 5.5.6 Assessment is an integral part of the teaching-learning Valid and reliable assessment should reflect the cycle. objectives and goals of the curriculum. It should be used as a tool both to collect data and to influence instruction. Since student performance cannot be described by a single set of scores or by a single type of assessment activity because of its complexity, evidence of learning should be collected through various modes of assessment activities, to reflect students' achievement in mathematics. Formative assessments, which have come to be considered increasingly important in the teaching and learning processes, are also recommended, to provide a complete picture of student performance and help improve the learning of students. Students should be given a chance to demonstrate what they learn and how they apply their knowledge and skills of mathematics. Project work, class discussions, oral presentations and observations of performance students' during lessons are useful assessment activities and should be integrated with other activities. А description of minimal classroom competence, which is the pre-requisite to the learning of

mathematics at the next advanced stage, is helpful to teachers for reporting student performance in terms of the basic knowledge, concepts and skills acquired.

- 5.5.7 Communication is also one of the skills which students need to learn in mathematics. It is essential to assess students' ability in communicating findings, presenting an argument and explaining an intuitive approach to a problem either in an oral or a written form. From the written and oral presentation of students, teachers are able to identify their strengths and weaknesses. Over-drilling for examinations, on the other hand, will hamper effective learning and should thus be discouraged.
- 5.5.8 Schools need to formulate their assessment policy according to their culture, teachers' experiences, students' needs and interests. The design of learning objectives, learning activities and assessment tasks should be aligned to ensure that what is intended will be properly taught and successfully learned.

#### 5.6 School-based Curriculum Development

Although both the revised primary and secondary mathematics curricula are recommended by CDC, schools are encouraged to carry out curriculum adaptation and integration, if deemed necessary, to meet the different needs, abilities and interests of students. The flexible elements introduced in the said curricula (i.e. foundation and non-foundation parts, and enrichment topics/activities) aim to help schools to design their school-based mathematics curriculum. For details, the two documents *Syllabuses for Primary Schools: Mathematics (Primary 1-6) (2000) (Second Draft)* and *Syllabuses for Secondary Schools: Mathematics (Secondary 1-5) (1999)* can be referred to.

#### 5.7 Life-wide Learning

In addition to formal mathematics education in schools, there are also opportunities for students to acquire learning experiences in mathematics outside schools. Typical examples include seminars, activities and learning packages jointly organized/developed by tertiary institutions/professional bodies/the government. Some popular activities are:

| Activities             | Specific Purposes      | Organizing Bodies      |
|------------------------|------------------------|------------------------|
| Mathematics            | The Competition aims   | Organized by the       |
| Competition for Hong   | to promote students'   | Professional Teachers' |
| Kong Primary           | interest in studying   | Union                  |

More details can be found from the booklet "全方位學習活動簡 介" (pp.8-9) published by "教育統籌委員會". The booklet can also be downloaded from the Internet at the web site http://www.life-wide-learning.org.

#### 5.8 Connections with Other Key Learning Areas

- 5.8.1 Mathematics is the foundation and supporting knowledge to many other disciplines. It is linked to the other 7 KLAs by providing a basis for making investigations as well as a tool for analyzing data, representing findings and models with symbols, graphs and charts, and theorizing knowledge. On the other hand, other KLAs enrich students with examples of the applications of mathematics in real-life situations.
- 5.8.2 Students learn through direct experience. Therefore, to relate students' daily life experiences with mathematics, teachers have to organize real-life experiences in

mathematical ways, skills and instruments. For some selected topics (like percentage and statistics), integration with other KLAs (like Science or Personal, Social and Humanities) is one of the ways of organizing students' learning experiences mathematically. Integrated learning removes the boundaries of subjects and reflects the interdependent nature of reality and the complexities of life. It provides students with a holistic context for learning and enables students to make connection with the real world in solving problems. An example showing how this is done can be found in exemplar 3 in Appendix 6. Some of the links between the Mathematics KLA and the other KLAs are exemplified in the following paragraphs.

- 5.8.3 In the Chinese Language and English Language KLAs, mathematical concepts are essential to understand essays with mathematical and statistical ideas. For the Arts Education KLA, lines and shapes are important elements to create pictures and models, and patterns and symmetry are often explored in creative dance. In the Physical Education KLA, mathematics can help to analyze sport data and design an appropriate strategy for striving for sporting excellence.
- 5.8.4 In the Personal, Social and Humanities KLA, a variety of mathematical tools and procedures are used in making rational and responsible social decisions, such as identifying patterns and trends in statistical data and assessing validity in personal and social issues. Mathematical models are also used in theorizing knowledge in Social Sciences, in particular, Economics.
- 5.8.5 In the Science KLA, laws and formulae are represented in mathematical language, mathematical methods are employed to solve problems and generalize experimental findings and mathematical models are used to represent physical phenomena. In the Technology Education KLA, mathematical models are used in computer simulations to explore the feasibility of applying design ideas to investment decisions, and tables and charts are usually important tools to represent technical information.

#### **6 CONCLUSION**

- 6.1 To meet the challenges of an ever advancing knowledge-based society and a dynamically changing environment, mathematics has unquestionably become one of the necessities for enabling every individual to contribute towards the prosperity of society. The curriculum framework of the Mathematics Education KLA not only aims to provide students with mathematical knowledge, but also aims to equip them with a repertoire of skills, to help them develop thinking abilities and to foster positive attitudes, so that they can develop capabilities to learn how to learn and the confidence to face the knowledge-based society.
- 6.2 The revised secondary and primary mathematics curricula have been developed along these lines and will be implemented in September 2001 and September 2002 respectively. The sixth form mathematics curriculum will be revised once the review of the new senior secondary structure is clear. Additional Mathematics will be revised in the near future to enhance its continuity with the mathematics subjects concerned.
- 6.3 In this framework, diversified teaching/learning activities and adaptation of the curriculum to suit the different needs, abilities and interests of students are recommended. Multifarious assessment instruments can also be used to get complete profiles of students' performance. These profiles should be used to improve teaching/learning.
- 6.4 Apart from formal mathematics education in schools, mathematics-related activities organized by schools and local/international bodies also provide opportunities for students to acquire learning experiences in mathematics. Students should be encouraged to participate actively in these activities.

Findings of the Research Studies Conducted in 1998

#### Findings of the Research Studies Conducted in 1998

The summaries<sup>8</sup> of the two research studies are as follows:

## Research Study 1 – Comparative Studies of the Mathematics Curricula of Major Asian and Western Countries

The study consists of three components: a literature review, an analysis of curriculum documents, and a summary of the HK results in the TIMSS. The main findings are:

- (a) The revised Secondary Mathematics Syllabus (1999) in HK is generally in line with worldwide trends.
- (b) The HK mathematics curriculum attempts to strike a balance between process abilities (which are very much emphasized in the West) and basic skills and content (which are stressed in Asian countries).
- (c) In HK, the introduction of topics into the curriculum is on average 2 years earlier than the international average.
- (d) The textbooks in HK focus much of their attention on students' performance of "knowing" and "using routine procedures".
- (e) A "canonical" curriculum is usually stipulated by the governments in Asian countries and is followed closely in schools.
- (f) East Asian countries put a lot of emphasis on textbooks; by contrast, Western countries are more flexible in their use of textbooks.
- (g) Tracking for mathematics teaching is common, and there are various ways of implementing tracking in different countries.
- (h) HK is probably the place with the least flexibility and choice in its mathematics curriculum.

The results of TIMSS, which are relevant to the theme of the study, are also summarized:

(a) HK students came fourth both in the 26 countries in grade four and the 41 countries in grade eight. They performed very well in routine problem solving, not so well in solving exploratory problems, and significantly worse in the TIMSS Performance Assessment, where students were required to conduct hands-on activities.

<sup>&</sup>lt;sup>8</sup> The summaries are abridged from Chapter 3 of the final report of the Ad hoc Committee, namely *Report on Holistic Review of the Mathematics Curriculum*.

- (b) Students in HK, like their counterparts in the rest of the TIMSS countries, found mathematics important, but they did not particularly like mathematics.
- (c) Contrary to the common belief that students in East Asian countries attribute success more to hard work than to natural talent or ability, and that they attach a lot of importance to memorization, the TIMSS results indicate that students do not totally support these stereotypes. Teachers in HK however did not tend to believe in natural talent.
- (d) Students in HK did not think that they did well in mathematics and in general, girls had a lower perception of their ability than boys.
- (e) Compared to their counterparts elsewhere, HK students spent more out of school time doing mathematics homework, studying mathematics or attending extra mathematics lessons, especially at the primary school level.

The results show that HK students did extremely well in the TIMSS mathematics tests, but some students did not display the corresponding level of positive attitudes towards mathematics and some lacked confidence in doing mathematics.

## Research Study 2 – An Analysis of the Views of Various Sectors on the Mathematics Curriculum

The main findings are:

- (a) Both students and parents showed high regard for mathematics.
- (b) Different stakeholders held a positive view of the mathematics curriculum.
- (c) Mathematics education should address a wider objective. HOTs should be addressed and teaching should provoke student thinking.
- (d) The interest of students has to be maintained.
- (e) The curriculum should be re-designed with epistemological and pedagogical considerations, so as to strengthen thinking and conceptual understanding.
- (f) The problem of learner differences has to be addressed, including curriculum differentiation at senior secondary level.
- (g) The idea of core and extended curriculum is worth further exploration.
- (h) Continuation at all levels should also be secured. Teachers at various learning stages should have knowledge of the curriculum of other learning stages.
- (i) Assessment and examination pressure should be carefully handled.
- (j) The teacher is the key person in curriculum reform and he/she needs guidance and support on various issues including use of IT, enhancement of process abilities and curriculum tailoring.
- (k) Pre-service and in-service teacher education should be strengthened.

- (l) Collegiate exchange in the field should be promoted.
- (m) Different stakeholders should be well informed of future curriculum changes, so that they provide support.
- (n) The workload of teachers should be carefully considered.

List of Tryout Topics/Teaching Strategies Conducted since 1997

#### List of Tryout Topics/Teaching Strategies Conducted since 1997

| Key Stages | Topics/Teaching Strategies  |  |  |  |  |  |  |  |  |
|------------|---|--|--|--|--|--|--|--|--|

An Overview of Learning Targets of the Mathematics Curriculum

#### An Overview of Learning Targets of the Mathematics Curriculum

#### **General Aims**

To enable students to cope confidently with the mathematics needed in their future studies, workplaces or daily life in a technological and information-rich society, so that each student is ready for lifelong learning, the curriculum aims at developing in students:

- (a) the ability to conceptualize, inquire and reason mathematically, and to use mathematics to formulate and solve problems in daily life as well as in mathematical contexts and other disciplines;
- (b) the ability to communicate with others and express their views clearly and logically in mathematical language;
- (c) the ability to manipulate numbers, symbols and other mathematical objects;
- (d) number sense, symbol sense, spatial sense and a sense of measurement as well as the capability of appreciating structures and patterns;
- (e) a positive attitude towards mathematics learning and the capability of appreciating the aesthetic nature and cultural aspect of mathematics.

#### Knowledge and Skills

|   | The Learning Targets for Key Stage 1 (P1-P3)  |   |                                |   |      |  |               |  |  |
|---|---|---|--------------------------------|---|------|--|---------------|--|--|
|   | Number and A  | lgebra  | Measures, Shape and Space Data |   |      |  | Data Handling |  |  |

Developing Generic Skills in the Mathematics Education Key Learning Area

#### Developing Generic Skills in the Mathematics Education Key Learning Areas

#### **Collaboration Skills**

Problem solving, planning and making decisions in a small group require the necessary collaboration skills, namely the skills of listening, appreciation, communication, negotiation, making compromises, asserting leadership, making judgement, as well as influencing and motivating others. Learners with these skills will be able to effectively engage in tasks and teamwork as well as working with others. Ultimately, learners will be able to form relationships that are mutually beneficial.

(The expected achievements of the learners in this type of generic skills cannot be suitably classified according to key learning stages)

| Descriptors of Expected Achievements<br>across the School Curriculum   | Exemplars of Implementation in Mathematics Education   |  |  |
|--|--|--|--|
| <ul> <li>Understanding working<br/>relationships</li> <li>Learners will learn to <ul> <li>clarify and accept various roles<br/>and responsibilities of<br/>individual members in a team<br/>and be willing to follow team<br/>rules</li> <li>recognize that individuals as<br/>well as the team have to take<br/>the consequences for their own<br/>actions</li> </ul> </li> </ul> | <ol> <li>Learners</li> <li>share responsibilities and understand the roles of individual<br/>members in doing mathematical group work like collecting<br/>data, measuring objects and presenting projects</li> <li>understand and accept that members with different cultural<br/>backgrounds may have different interpretations of a<br/>mathematical problem (e.g. analyzing statistical data)</li> <li>accept and follow the group decision in doing mathematical<br/>group work</li> </ol>       |  |  |
| <ul> <li>Developing attitudes which contribute to good working relationships</li> <li>Learners will learn to <ul> <li>be open and responsive to others' ideas; appreciate, encourage and support the ideas and efforts of others</li> <li>be active in discussing and posing questions to others, as well as in exchanging,</li> </ul> </li> </ul>                                 | <ol> <li>Learners</li> <li>discuss and exchange ideas openly with others in<br/>completing tasks and solving mathematical problems</li> <li>be patient and listen to others in the discussion of<br/>mathematical problems like experience-sharing in the<br/>processes of investigating number patterns or formulating<br/>proofs of geometric problems</li> <li>value the contributions of others in accomplishing<br/>mathematical tasks or solving mathematical problems<br/>together</li> </ol> |  |  |
| <ul> <li>wen as in exchanging,<br/>asserting, defending and<br/>rethinking ideas</li> <li>recognize and avoid<br/>stereotyping; withhold<br/>premature judgement until the<br/>facts are known</li> <li>be willing to adjust their own<br/>behaviour to fit the dynamics<br/>of various groups and<br/>situations</li> </ul>   | <ol> <li>appreciate different solutions to mathematical problems<br/>presented by others, for example, in using different<br/>approaches to proving mathematical theorems</li> <li>participate actively and pose questions in clarifying one's<br/>arguments in solving mathematical problems, for example,<br/>in the discussion of strategies to be adopted in investigating<br/>practical statistical problems</li> </ol>   |  |  |

| Descriptors of Expected Achievements   | Evennlars of Implementation in Mathematics Education   |  |  |

| Achieving effective working  | Learners   |  |  |
| relationships  | 1. share experience in solving mathematical problems and   |  |  |
| Learners will learn to   | select cooperatively a suitable strategy to solve a  |  |  |
| <ul> <li>select a strategy and plan</li> </ul>   | mathematical problem   |  |  |
| cooperatively to complete a task in a team   | 2. clarify their arguments objectively and rationally in solving mathematical problems, for example, in examining the  |  |  |
| <ul> <li>understand the strengths and<br/>weaknesses of members and</li> </ul>                             | appropriateness of the strategy adopted in solving mathematical problems   |  |  |
| build on the strengths to 3.<br>maximize the potential of the<br>team                                      | 3. liaise, negotiate and compromise with others in selecting a suitable strategy for solving a mathematical problem (e.g. use a synthetic or analytic approach in solving a geometrical                                |  |  |
| <ul> <li>liaise, negotiate and</li> </ul>  | problem)   |  |  |
| compromise with others   | <ol> <li>make adjustment, if necessary, to the strategy adopted in<br/>solving mathematical problems (e.g. is it necessary to solve<br/>a given quadratic equation to prove that it has no real<br/>roots?)</li> </ol> |  |  |
| <ul> <li>reflect on and evaluate the<br/>group work strategy and make<br/>necessary adjustments</li> </ul> |  |  |  |

#### **Communication Skills**

Communication is a dynamic and ongoing process in which two or more people interact in order to achieve a desired outcome or goal. In learning to communicate effectively, learners should learn to speak, listen, read and write effectively. They should learn to select the most appropriate means to convey a message in accordance with the purpose and context of the communication. They should use accurate and relevant information and organize it systematically and coherently for their audience. They should also evaluate the effectiveness of their communication and identify areas of improvement for action.

#### Creativity

A brief description: Creativity is an important but elusive concept. It has been defined in a variety of ways. Some people define it as an ability to produce original ideas and solve problems, others see it as a process, and yet others take it as certain personal qualities. In fact, creativity is a complex and multifaceted construct. Within the individual, creative behaviour is the result of a complex of cognitive skills/abilities, personality factors, motivation, strategies, and metacognitive skills. Person's creative performance may not correspond to his/her developmental stages.

**General Principles:** Although the demanding process of teaching for creativity is hard to make routine, some principles apply in general. To develop students' creativity, we ask them to go beyond the given information, allow them time to think, strengthen their creative abilities, reward their creative efforts, value their creative attributes, teach them creative thinking techniques and the Creative Problem Solving model, and create a climate conducive to creativity<sup>1</sup>. These principles can be employed in all key learning areas (KLAs).

(The expected achievements of the learners in this type of generic skills cannot be suitably classified according to key learning stages)

| Descriptors of Expected Achievements<br>across the School Curriculum                            |  | Ex  | emplars of Implementation in Mathematics Education  |  |
|---|--|-----|---|--|

| •   | <b>strengthen creative abilities</b> :<br>fluency <sup>2</sup> , flexibility <sup>3</sup> , originality <sup>4</sup> ,   | 1.  | create geometric patterns with different shapes and tell stories with given mathematical sentences  |  |
|   | elaboration <sup>5</sup> , sensitivity to problems <sup>6</sup> , problem defining <sup>7</sup> ,  | 2.  | devise their own way/strategy in solving problems such as different solutions to a plane geometry problem   |  |
|   | visualization <sup>8</sup> , imagination,<br>analogical thinking <sup>9</sup> , analysis,<br>synthesis, evaluation,  | 3.  | adopt different approaches to a task or problem, such as<br>proving a geometrical theorem using a synthetic or an<br>analytical approach  |  |
|   | thinking, etc.   | 4.  | pose related problems such as "Can triangles other than equilateral triangles be used in tessellation?" and "Will the   |  |
| <ul> <li>develop creater attributes: is self-confider judgement, commitmer ambiguity</li> </ul> | develop creative attitudes and attributes: imagination, curiosity,   |     | same relationship $a^2 + b^2 = c^2$ in Pythagoras' Theorem still hold if the triangle is not right-angled?"   |  |
|   | judgement, persistence and<br>commitment, tolerance for<br>ambiguity, openness to new and  | 5.  | formulate hypotheses such as that the value of a fraction<br>decreases as the denominator increases if the numerator is<br>kept constant  |  |
|   | unusual  | 6.  | be persistent when solving problems   |  |
|   | ideas/methods/approaches,  | 7.  | be imaginative in visualizing 3-D shapes  |  |
|   | deferment of judgement,<br>adaptability, willingness to take<br>sensible risks, etc.   | 8.  | be open-minded to new methods and approaches in<br>accomplishing tasks and solving problems, such as using a<br>synthetic or an analytic approach in solving geometrical  |  |
| •   | use and apply the Creative   |     | problems  |  |
|   | Problem Solving (CPS) Model<br>and creative thinking<br>techniques: brainstorming, 6W<br>thinking technique, 6 hats<br>method, attribute listing <sup>11</sup> , idea<br>checklists, synectics <sup>12</sup> , mind<br>mapping, etc. | 9.  | use and apply the technique of synectics to relate different<br>given information, and utilize analogies to help analyze<br>problems, such as deducing the formula of the volume of a<br>cylinder from that for a prism |  |

#### Notes:

- 1. Climate conducive to creativity: Respecting the novel and unusual, providing challenges, appreciating individuality and openness, encouraging open discussion, absence of conflicts, allowing time for thinking, encouraging confidence and a willingness to take risks, appreciating and supporting new ideas, etc.
- 2. Fluency: The ability to produce many ideas in response to an open-ended problem, question or task.
- 3. Flexibility: The ability to take different approaches to a task or problem, to think of ideas in different categories, or to view a situation from several perspectives.
- 4. Originality: Uniqueness, nonconformity in thought and action.
- 5. Elaboration: The ability to add details to a given idea, such as to develop, embellish, and implement the idea.
- 6. Sensitivity to problems: The ability to identify problems, list out difficulties, detect missing information, and ask good questions.
- 7. Problem defining: The capability to 1) identify the "real" problem, 2) isolate the important aspects of a problem, 3) clarify and simplify a problem, 4) identify subproblems, 5) propose alternative problem definitions, and 6) define a problem broadly.
- 8. Visualization: The ability to fantasize and imagine, "see" things in the "mind's eye" and mentally manipulate images and ideas.
- 9. Analogical thinking: The ability to borrow ideas from one context and use them in another; or the ability to borrow the solution to a problem and transfer it to another.
- 10. Transformation: The ability to adapt something to a new use, to "see" new meanings, implications, and applications, or to change an object or idea into another creatively.
- 11. Attribute listing: A creative thinking technique that involves listing out all the important characteristics of an item and suggesting possible changes or improvements in the various attributes.
- 12. Synectics: The joining together of apparently unrelated elements. This technique utilizes analogies and metaphors to help the thinker analyze problems and form different viewpoints.

#### **Critical Thinking Skills**

Critical Thinking is drawing out meaning from given data or statements. It is concerned with the accuracy of given statements. It aims at generating and evaluating arguments. Critical thinking is the questioning and inquiry we engage in to judge what to and what not to believe.

IT skills are the ability to use IT to seek, absorb, analyze, manage and present information critically and intelligently. In addition, IT will motivate and empower our learners to learn at their own pace and help them develop habits of self-learning, which will benefit them for life.

| •                                    | recognize the complexity of the problem and search for   | approach (e.g. exploring the meaning of probability through various activities)  |
|                                      | appropriate information<br>required to solve it  | 2. appreciate and formulate feasible strategies to achieve the solution of a problem (e.g. calculating probability by  |
| •                                    | formulate feasible strategies to<br>achieve optimal results,<br>considering both long term as<br>well as short term objectives | <ul> <li>3. judge and evaluate mathematical arguments (e.g. "Two triangles are congruent because their corresponding angles are equal.")</li> </ul>  |
| •                                    | monitor and critically reflect on<br>the progress in solving the<br>problem  | 4. monitor and analyze the given information critically (e.g. recognizing the dangers of misinterpreting statistical data)   |
| •                                    | evaluate the overall strategy and<br>anticipate possible future<br>problems related to the solution                            |  |

Self-management skills are essential for the building up of self-esteem and the accomplishment of goals. Learners who have mastered self-management skills understand their own feelings and preserve emotional stability. They are positive and proactive towards work. They set appropriate goals, make plans and initiate actions to achieve them. They manage time, money and other resources well. They are able to handle stress and tolerate ambiguities.

#### Learners will learn to

- 1. evaluate their own feelings, strengths, weaknesses, progress and objectives (self-assessment)
- 2. consider aspects of their performance, attitudes and behaviour in order to change or enhance future outcomes (self-reflection)
- 3. be confident in their own judgements, performance and capabilities (self-confidence)
- 4. make informed decisions and safe choices in reaching goals and carrying tasks, develop good habits and maintain a healthy life style (self-discipline)
- 5. work under unfamiliar, stressful or adverse conditions, accept changes and new ideas and be able to handle diversity and tolerate ambiguity (adaptability)
- 6. make decisions and initiate actions on their own and draw satisfaction from their own effort (self-motivation)
- 7. keep promises and fulfill obligations (sense of responsibility)
- 8. control their own emotions and impulses and maintain emotional balance (emotional stability)

(The expected achievements of the learners in this type of generic skills cannot be suitably classified according to key learning stages)

**Related Values and Attitudes** 

#### **Related Values and Attitudes**

Besides knowledge and skills, the development of positive values and attitudes is also important in mathematics education. These values and attitudes permeate the mathematics curriculum in different learning dimensions and key stages of learning and have been incorporated into the learning objectives of the revised primary and secondary curricula. The following learning objectives illustrate how the revised mathematics curricula relate to the development of positive values and attitudes and aim at facilitating the planning of relevant learning experiences in the Mathematics KLA. These learning objectives, however, are neither exhaustive nor implying that the related values and attitudes should progress in the order stated. In fact, they can be realized at different key stages to different extents.

- Develop **interest** in learning mathematics.
- Show **keenness** to participate in mathematical activities.
- Develop **sensitivity** towards the importance of mathematics in daily life.
- Show **confidence** in applying mathematical knowledge in daily life, clarifying one's argument and challenging others' statements.
- Share ideas and experience and work **co-operatively** with others in accomplishing mathematical tasks/activities and solving mathematical problems.
- Understand and take up one's **responsibilities** in group work.
- Be **open-minded** in doing group work, willing to listen to others in the discussion of mathematical problems and respect others' opinions, value and appreciate others' contributions in doing mathematics together.
- **Think independently** in solving mathematical problems.
- Be **persistent** in solving mathematical problems.
- **Appreciate** the precise, aesthetic and cultural aspects of mathematics and the role of mathematics in human affairs.

Exemplars

#### <u>Exemplar 1 : Bead Game</u>

#### Learning Dimension: Number

Learning Unit: Numbers to 10

Key Stage: 1

**Objective:** To develop an understanding of the composition of numbers 1 – 10.

#### Prerequisite Knowledge:

Pupils should be able to (i) count and read the number of objects.

- (ii) recognize odd and even numbers.
- (iii) compare two types of objects by one-to-one correspondence.

**Teaching Resources:** (i) Beads

(ii) Stickers

(iii) Worksheets (Bead Game)

#### **Description of the Activity:**

Activity 1:

- 1. Pupils are grouped in pairs. Each group of pupils is given with 10 beads.
- 2. Teacher asks pupils to take out 4 beads and group them into two sets (each set has at least 1 bead). Pupils are requested to explore the different ways of grouping that can be found and record their findings by using stickers on the worksheets as shown in the following figures.

#### **Questions for Discussion:**

- 1. How many different ways can be found by grouping 4 beads into 2 sets?
- 2. If one more bead is put in the shaded region, what is the change in the number of beads in the unshaded region?
- 3. If more and more beads are put in the shaded region, what is the change in the number of beads in the unshaded region?
- 4. How can you ensure that all combinations are found?

#### **Notes for Teachers:**

- 1. As pupils do not understand the concept of "0" at this stage, teachers should give hints to pupils to put at least 1 bead in the shaded or unshaded region.
- 2. If stickers are not used, teachers can ask pupils to draw their results on the worksheets.

#### Activity 2:

- 1. Pupils repeat the procedures in Activity 1 for grouping 2 to 10 beads into two sets and find the different compositions of each number.
- 2. Pupils record the results by using stickers on the worksheets.

#### **Questions for Discussion:**

- 1. Repeat the discussion in Activity 1.
- 2. According to the results in Activity 2, which numbers have the same quantity of beads in the shaded and unshaded regions when grouping the beads into 2 sets? (2, 4, 6, 8, 10)
- 3. What is the characteristic of these numbers? (Teacher leads pupils to find out that these are even numbers.)

#### **Notes for Teachers:**

As pupils do not understand the concept of "0" at this stage, 2 to 10 beads should be used in the Activity.

#### Activity 3:

 Teacher asks pupils to observe the results in Activity 2 by grouping 10 beads into two sets as shown in the following figures.

2. Teacher writes the numbers from 1 to 9 on the blackboard. Pupils then join the numbers together from the above results and describe the rule they find as follows.

#### **Questions for Discussion:**

- 1. Which number cannot be joined to another number? Why?
- 2. If we need to join a line to this number, what is its partner? Why?

This exemplar involves the following generic skills :

- 1. Critical Thinking
  - Understand straightforward cause and effect relationships, such as, adding one bead in the shaded region will cause decreasing one bead in the unshaded region.
  - Reason inductively in exploring ways of finding out all the combinations.
  - Reason inductively such as exploring the characteristic of numbers.
  - Draw logical conclusions based on adequate data and evidence, for example, by joining the number together by observing the results of grouping 10 beads into 2 sets.

- 2. Communication
  - Comprehend and act appropriately on spoken instructions, for example, by following teachers' instructions to group the beads into 2 sets and to record the findings on the worksheet.
  - Present results of tasks with drawings and symbols.
  - Discuss with others in accomplishing tasks, for example, by grouping the beads into 2 sets.
- 3. Problem Solving
  - Learn from past experience to solve new problems in grouping 2 to 10 beads.
  - Adopt various ways of solving problems, for example, by finding out all combinations by transferring beads one by one from one region to another region or by putting some beads in one region and then the rest in another region.

#### **Bead Game**

Group beads into two sets and record the results by putting stickers on the figures below.

#### Exemplar 2 : Making Solids

#### **Learning Dimension:** Shape and Space

**Learning Unit:** 3-D shapes (III)

Key Stage: 2

#### **Objectives:** (i) To make solids with cubes.

- (ii) To explore the methods used to make all possible solids with cubes.
- (iii) To describe the solids made.
- (iv) To group the solids made.
- (iv) To describe the methods used in grouping the solids.

#### **Prerequisite Knowledge:**

Pupils should be able to identify and describe 2-D and 3-D shapes.

**Teaching Resources:** (i) Cubes (ii) Grid paper

#### **Description of the Activity:**

#### <u>Activity 1:</u>

- 1. Teacher gives each pupil a box of cubes.
- 2. Pupils make solids with two cubes and display them on the desk.
- 3. Repeat the activity in (2) with three, four and five cubes.
- 4. Pupils are grouped in pairs to describe the solids to each other.
- 5. Pupils group the solids into several categories according to the characteristics of the solids.

#### **Questions for Discussion:**

- 1. How many solids can be formed with two, three, four and five cubes?
- 2. Are you able to make all the possible solids? How?
- 3. What are the rules you followed in grouping the solids?

#### **Notes for Teachers:**

- 1. Teachers should let pupils explain freely their ways of making and grouping solids with cubes freely.
- 2. All the possible solids made with four cubes are as follows:

 Any shapes which are formed by rotating or turning over other shapes are counted as identical.
 For example: the three solids below are considered to be the same.

4. Through observing pupils' performance in class, teachers can identify their strengths and areas for improvement in learning shapes. Ways to improve their spatial sense can then be sought.

#### <u>Activity 2:</u> (For more able pupils)

Record the solids made in Activity 1 on the grid paper. For example: The following shapes are formed by using three cubes.

#### **Notes for Teachers:**

Teachers can prepare grid papers using suitable software. If Cabri Geometry is used, press "Define Grid" to show the axes. Move the x and y axes to form a grid.

This exemplar involves the following generic skills:

- 1. Communication
  - Describe the solids orally with simple and appropriate mathematical terms.
  - Explain orally the rules they followed in grouping the solids.
  - Present the results of tasks with appropriate drawings and symbols, for example, by recording the solids made in Activity 1 on the grid paper.
- 2. Critical Thinking
  - Categorize information using various criteria, for example, by grouping the solids into several categories according to the characteristics of the solids.
  - Reason inductively in the process of exploring ways of making all the possible solids.
- 3. Problem Solving
  - Use simple methods in solving problems, for example, by devising an appropriate plan for making solids.
  - Apply knowledge learnt from past experience to solve new problems, for example, by making solids with 4 and 5 cubes, based on the experience of making solids with 3 cubes.

#### Exemplar 3 : Knowing Your Community (Cross-curricular project)

Learning Dimension: Shape & Space, Data Handling

Learning Unit: The eight compass points and bar charts (I)

#### Key Stage: 2

**Objectives:** (i) To find the eight compass points with a compass.

- (ii) To become familiar with the district in the vicinity of the school.
- (iii) To sketch the city plan of the district in the vicinity of the school.
- (iv) To be aware of the facilities and services offered in the community.
- (v) To present the collected data with statistical charts.

#### Prerequisite Knowledge:

Pupils should be able to: (i) find the four directions with a compass; (ii) construct a simple bar chart.

#### Teaching Resources: Compasses

#### **Description of the Activity:**

Activity 1:

- 1. Pupils use compasses to find the four directions and describe the facilities within the school vicinity in those directions.
- 2. Pupils use compasses to find the eight compass points and record the facilities within the school vicinity in those directions.

#### **Questions for Discussion:**

- 1. Will the directions of the facilities change when you are in different positions?
- 2. Will the directions of the facilities change when you are in the same position but face a different direction?

#### <u>Activity 2:</u>

Pupils are divided into groups to do the following tasks:

1. Sketch the city plan of the area in the vicinity of the school, with the help of compasses. For example,

(Since distances between facilities are not the main concern of this activity, pupils can estimate them intuitively.)

2. Collect information on the facilities and services available within the school vicinity, for example, the number of supermarkets, parks, markets, libraries, the condition and maintenance of the facilities, the frequency with which the facilities are used by the residents, etc.

(More able pupils can collect information by conducting a small-scale survey.)

- 3. Analyze the information collected and present the data with appropriate statistical charts, such as bar charts. Teachers can encourage pupils to make use of new technology in presenting their findings and reports. For example, pupils can record data and draw statistical charts by spreadsheet, compile the report by word processor and take pictures of the facilities with digital cameras, etc.
- 4. Discuss the statistical charts constructed and report the findings orally or in written form.
- 5. Suggest ways to improve the city planning of the area in the vicinity of the school.

#### **Questions for Discussion:**

- 1. What kinds of facilities are provided in the district?
- 2. Which types of facilities do you think are in excess? Why?
- 3. Which types of facilities do you think are insufficient? Why?
- 4. If you were a town planner, how would you redesign this district?
- 5. How can you protect and improve the environment of the community?

#### Notes for Teachers:

- 1. Pupils should be given adequate time to do the project.
- 2. Teachers should give explicit instructions and suggest ways to collect data.

This exemplar involves the following generic skills:

- 1. Collaboration
  - Share responsibilities and understand the roles of individual members in collecting data and presenting projects.
  - Discuss and exchange ideas openly with others in sketching the city plan and deciding information which needs to be collected.
  - Listen to others patiently in discussions of the information collected.
  - Understand and accept different interpretations in analyzing statistical data and ways of improving the city plan from members with different socio-economic backgrounds
  - Participate actively in the project, for example, in discussing strategies to be adopted for collecting information on the facilities.
  - Agree a suitable strategy to collect information.
  - Liaise, negotiate and compromise with others in selecting a suitable strategy for collecting information and in suggesting a new city plan.
- 2. Critical Thinking
  - Extract, classify and organize information collected from the area in the vicinity of the school.
  - Understand the concepts of relevance and irrelevance, for example, in identifying the relevant information useful for supporting the proposed city plan.
  - Draw logical conclusions based on adequate data and evidence, for example, in making suggestions for improving the city planning, based on the information collected.
- 3. Problem Solving
  - Choose the relevant information to solve problems, for example, by identifying the statistical data necessary for giving suggestions for improving the city planning.
  - Make use of various tools in solving problems, for example, using a tally in counting the frequency with which the facilities are used and ballots to collect opinions about the level of
satisfaction with the condition of the facilities.

- 4. Creativity
  - Strengthen creative abilities such as originality, sensitivity to problems, problem formulating and analysis, through the process of designing their own projects, presenting the city plan in their own ways and suggesting ways of improving the city planning.
- 5. Numeracy
  - Recognize the 8 compass points.
  - Organize simple data and interpret simple statistical graphs in daily-life situations, for example, in investigating the facilities within the school vicinity.
  - Choose the correct form of numbers in presenting information, for example, by using percentages to tell how many people are satisfied with the conditions of the facilities.

# Exemplar 4: Graphical Representation of Linear Equations

Learning Dimension: Number & Algebra

**Learning Unit:** Linear Equations in Two Unknowns

Key Stage: 3

**Objective**: To explore the graphical representation of linear equations in 2 unknowns with the help of IT tools

**Prerequisite Knowledge:** (i) Using paper and pencil to plot graphs of simple linear equations in 2 unknowns.

(ii) Basic manipulation skills on the hardware and spreadsheet software or graphing calculators.

**Teaching Resources:** Spreadsheet software such as EXCEL or graphing calculators

# **Description of the Activity:**

- 1. After asking students to plot the graph of the simple linear equations with paper and pencil, the teacher can then ask students to explore graphs of different linear equations with the software EXCEL or with graphing calculators.
- 2. The following worksheet is prepared. A brief explanation of the set-up of the worksheet is given. It includes:
  - the set-up of cells A1, A2, A3 for the text of the equation name and the values for a and b;
  - values of x to be keyed in or pre-set in the worksheet;
  - values of a and b to be keyed in;
  - the definition of y from the corresponding values of x.

Besides the algebraic language, the teacher may introduce the definition of y in EXCEL language.

- 3. Students are asked to explore graphs of different equations in the following categories:
  - Set b=0 and explore the shape of the graphs of y = ax by changing values of a.
  - Set a=1 and explore the shape of the graphs of y = x+b by changing values of b.
  - Set b to any constant values and explore the shape of the graphs of y = ax+b by changing values of a.

Students are asked to contrast the steepness and the intercepts of the resulting graphs. Discussions on the graphs of these categories of equations can then be held.

#### **Notes for Teachers:**

- 1. Teachers can prepare the worksheet prior to the lesson so that students can spend more time in exploring graphs of different equations. The steps in preparing the worksheet are as follows:
  - Define A1 as "y = ax + b".
  - Define A2 as "a=", A3 as "b=", D2 as "x" and D3 as "y".
  - Key in values of cells B2 and B3 as 0 and 1 respectively.

- Key in –3, -2 to the cells E2 and F2 and then copy these to other cells in the row.
- Define the values of y in the cell E3 as "=\$B\$2\*E\$2+\$B\$3".
- Copy this definition to other cells of y. The values of y will be generated automatically by the software.
- Highlight values of x and y and then use the SCATTER LINE GRAPH graphing facility to draw the graph.
- 2. Other graphing software such as WinPlot.exe, which can be downloaded from the Internet, can be used to serve a similar purpose. Keying the equation into the software can draw the graph. Alternatively, some graphing calculators also provide such facilities. EXCEL is used for this demonstration because of its availability in most schools. Its facility in showing tables and graphs of different equations on one screen is an advantage to facilitate students to visualize the change of equations on the numerical and graphical values simultaneously. Below are some examples using graphing calculators in the exploratory activity. Students can use the TRACE function built into the graphing calculators to explore points on the line and the relation of the coordinates of the points with reference to the equation.

Students then observe the coordinates of points not lying on the straight line and compare the coordinates with those on the straight lines.

| F1770 F27 F3 F4<br>Zoom Trace ReGr                                      | aph Math Draw 🕶 🖉             | F17700 F2▼ F3 F4 F5▼ F6▼ F7<br>▼ £ Zoom Trace ReGraph Math Draw ▼ € |                          |  |
|---|-------------------------------|---|--------------------------|--|
| × 92<br>0. 5.<br>1. 7.<br>2. 9.<br>3. 11.<br>4. 13.<br>5. 15.<br>6. 17. | ↔<br>xc:1.03448<br>yc:9.89796 | $\begin{array}{c ccccccccccccccccccccccccccccccccccc$               | xc:1.03448<br>yc:7.04082 |  |
| MAIN DEG AUTO   | FUNC                          | MAIN DEG AUTO   | FUNC                     |  |

Teachers should remind students of the problems they will encounter when tracing the coordinates of the points on the straight line. (e.g. It is not easy to "trace" a point on the straight line and y does not equal ax+b exactly, due to rounding error.)

- 3. Students familiar with the EXCEL platform can set up their own worksheet. They can design their own styles of graphical presentation and tabular representations. The program is then no longer a black box to students. The definition of y also enhances students' understanding of the concepts of variables and constants.
- 4. The program can be modified to have the tables and graphs of 2 equations (or more) presented simultaneously on one screen. This helps students to compare the graphs of different equations.
- 5. After this activity, students are expected to recognize that
  - the shape of a linear equation in 2 unknowns is a straight line;
  - the line with the equation y = ax passes through the origin and the inclination of the line depends on the values of a;
  - the equation of y = b is a straight line parallel to the x-axis;
  - the value of b is the y-intercept of the equation y = ax + b.

This exemplar involves the following generic skills:

- 1. Information Technology
  - Use computer software EXCEL or graphing calculators to carry out the exploratory activities.
- 2. Numeracy
  - Use different values of a and b for y=ax+b to investigate the effects of changes in these values on the shape of the graph.
  - Observe the graph and make estimates of the values of b.
- 3. Critical Thinking
  - Compare the values used for a and b in y=ax+b and note the effects of the changes in these numbers on the shape of the graph and hence draw conclusions about their findings in discussion.
- 4. Problem Solving
  - Explore the first part of the problem (i.e. by setting b=0) by following the procedures suggested in the exemplar.
  - Adjust their strategy of exploration, for example, using ascending numbers or descending numbers.
  - Plan and adopt an appropriate strategy by designing their own styles of graphical presentation and tabular representation.

- **Remark:** At present, teachers quite often use graph board or overhead transparency to illustrate the graphs of linear equations in two unknowns. However, they are not effective methods as only a few equations could be drawn in a lesson and it is not flexible enough for students to do exploration. The following merits can be obtained with the use of IT:
  - A great variety of graphs could be shown within seconds.
  - It allows students to propose their own equations and make guess on the shapes of the graphs.
  - With the numeric (tabular), graphic, and algebraic representations of the equations shown on one screen, students can see the changes in the numeric and graphic forms of the equations simultaneously whenever there is change in the algebraic form. This presentation facility can help students build up a stronger sense of the meaning of algebraic forms of equations.

## **Exemplar 5: Graphs of Quadratic Functions, y=ax<sup>2</sup>+c**

Learning Dimension: Number & Algebra

**Learning Unit:** Functions and Graphs

Key Stage: 4

**Objectives:** To investigate the graphical meaning of a and c in the quadratic function  $y=ax^2+c$  with the help of IT tools

**Prerequisite Knowledge:** (i) The notation and basic concepts of functions

- (ii) Intuitive ideas on the shape of the quadratic function  $y=ax^2+bx+c$
- (iii) The shape of the graph  $y = x^2$

**Teaching Resources:** Spreadsheet software or WinPlot.exe downloaded from the web site: http://academy.exter.edu/~rparris

## **Description of the Activity:**

- 1. Students are divided into groups. Then they are asked to work on the WinPlot platform to explore the quadratic function  $y = ax^2 + c$
- 2. The value of c is set to zero. Students are asked to explore the shape of the function with the value of a changing from 1 to 10 and also from -1 to -10. Students are asked to observe the changes of the shapes of the graphs with increasing values of a. The animation can be produced by the software. Similarly,

observations and discussions should be made when the value of a becomes negative.

3. By setting the value of a to 1, students are asked to observe the changes of the graph for different values of c.

- 4. Students are then asked to make conjectures on the shapes of the following graphs. They are given the graph of  $y = x^2$ . They should sketch their conjectures on the diagram provided.
  - a)  $y = 2x^2$
  - b)  $y = 2x^2 + 3$
  - c)  $y = 4x^2 5$
  - d)  $y = -3x^2 + 4$

Discussions on their conjectures should be made. The graphical meaning of a and c of

 $y = ax^2 + c$  should be discussed and summarized.

## **Notes for Teachers:**

- 1. The teacher should remind students that the notation of  $x^2$  in the program is  $x^2$ . This notation is commonly used in many software packages or computer languages.
- 2. The diagrams from WinPlot in sketching the quadratic function can be adjusted. If the teacher finds that students cannot follow the animation produced, the program can be adjusted to have the

## Appendix 6

## diagrams drawn one by one.

- 3. At the end of the activity, students are expected to recognize that
  - the graph is symmetrical about the y-axis
  - the coefficient of  $x^2$ , a, affects the direction of opening and the slope of the curve
  - the constant c is the y-intercept of the parabola
  - the constant c in  $y = ax^2 + c$  is the translation of  $y = ax^2$  along the y-axis.
  - the minimum or the maximum value of the function is c.

This exemplar involves the following generic skills:

- 1. Information Technology
  - Make use of the computer software *Winplot* to do their own investigations.
  - Use the animation function provided by the software to

explore the effect of coefficients on the quadratic graphs.

- 2. Numeracy
  - Understand the meaning of the mathematical formula  $y = ax^2 + c$ .
  - Investigate the effects on the graphs of the quadratic function by using different values of *a* and *b*.
- 3. Critical Thinking
  - Discover the properties of quadratic functions, classify them according to their properties (e.g. opening upwards / downwards, narrow / flat when compared with the graph  $y = x^2$ ; shifting the vertex and etc) and generalize their observations from several examples.
  - Predict the graphs of other functions and make use of the software to check their predictions.
- **Remark:** Teachers quite often use graph board or overhead transparency to illustrate graphs of quadratic functions. Clearly, they are not effective methods as only a few graphs could be drawn in a lesson and it is not flexible enough for students to explore other equations not prepared. The following merits can be obtained with the use of IT:
  - A great variety of graphs could be drawn and shown within seconds.
  - It allows students to explore different functions and check their conjecture on the relation between the shapes of the graphs and their functions.
  - With the facility of showing several graphs on one screen, it is easier for students to compare graphs of functions with different coefficients, different constant terms, etc.

## Exemplar 6: Bus Reports

#### Learning Dimension: Data Handling

Learning Unit: Uses and Abuses of Statistics

Key Stage: 4

- **Objectives:** (i) To enhance students' interest and understanding in analyzing and comparing data
  - (ii) To develop students' critical thinking skills in examining the interpretations of the set of given data.

**Prerequisite Knowledge:** Fundamental knowledge and simple manipulations of percentages

**Teaching Resources:** Information regarding the publicity and advertisement for bus routes, bus operations etc.

#### **Description of the Activity:**

- 1. The bus is one of the main means of mass transportation in Hong Kong and is familiar to students. With reference to the exploration of the routine operations of bus companies, students are expected to strengthen their knowledge and to care about things around them. Students will understand the importance of background information in the interpretation of data analysis.
- 2. Teachers can raise the following problems for motivation:
  - a) How many public bus companies do we have in Hong Kong?
  - b) Compare the three cross-harbour tunnel routes connecting Hong Kong Island and Kowloon Peninsula with regard to the following:
    - (i) the cross-harbour tunnel bus routes;
    - (ii) the lengths of the cross-harbour tunnels;
    - (iii) the location of the entrance to each tunnel;
    - (iv) the toll for each tunnel;
    - (v) the traffic congestion for each tunnel.
  - c) Will an increase in the frequency of buses crossing the tunnels worsen the traffic congestion inside the tunnels?
- 3. After giving the following table to students, ask them to investigate the problems concerning the punctuality of bus route schedules for two different bus companies.

| Route   | Company A   |           | Company B   |           |
|---|-------------|-----------|-------------|-----------|
|   | Punctuality | Frequency | Punctuality | Frequency |
|   | (%)         |           | (%)         |           |
| I. Via Cross-<br>harbour<br>Tunnel to Sai<br>Ying Pun | 86.7        | 922       | 78.5        | 534       |
| II. Via Cross-<br>harbour<br>Tunnel to<br>North Point | 82.5        | 2056      | 74.1        | 312       |
| III.Via Cross-<br>harbour<br>Tunnel to Chai<br>Wan    | 94.1        | 568       | 92.2        | 1534      |
| IV. Via Western<br>Harbour<br>Tunnel to<br>Tsuen Wan  | 96.2        | 265       | 93.7        | 1653      |
| Total   | 86.2        | 3811      | 89.6        | 4033      |

# Table 1The punctuality of bus route schedules for two<br/>different bus companies

## **Problems for Discussion:**

- 1. How do you calculate the overall punctuality percentage for each company in Table 1?
- 2. If the punctuality for each bus route is compared solely from the information provided in the above table, it is obvious that the performance of company A is much better than that of company B. However, why is the overall performance of the former worse than that of the latter?
- 3. If it is assumed that the delays of the bus schedules are due to traffic congestion, as claimed by the drivers of bus routes I and II, is this point valuable in comparing the punctuality of the schedules of the two companies?

## **Notes for Teachers:**

- For problems raised in question 2, teachers can arrange a short Question-and-Answer competition for students, in order to identify their understanding of the background information.
- For question 1, the method of calculation for "overall

punctuality percentage" in Table 1 is as follows.

The overall punctuality percentage of bus company A =  $\frac{86.7 \times 922 + 82.5 \times 2056 + 94.1 \times 568 + 96.2 \times 265}{922 + 2056 + 568 + 265} = 86.2$ 

[The percentage for that of bus company B can be found in a similar way.]

- For questions 2 and 3, teachers should guide students to observe the following from Table 1.
  - For bus company A, the "Punctuality" percentage is the lowest for the route with the highest frequency. On the other hand, the "Punctuality" percentage is the highest for the route with the highest frequency for bus company B.
  - The background information provided by the drivers indicates that bus company A made a mistake by putting a large number of bus routes into the congested areas, leading to the lowering of the overall performance.

This exemplar involves the following generic skills:

- 1. Communication
  - Use mathematical language to explain how to find the overall punctuality percentage for each company.
  - Make their own reasonable arguments from the relevant evidence.
- 2. Numeracy
  - Apply the correct formula to calculate the overall punctuality percentage from individual percentages.
- 3. Critical Thinking
  - Judge and evaluate the contradicting arguments arising from Problem 2.
  - Make their own arguments that greater individual punctuality percentages may not give rise to a greater overall punctuality percentage.
