Clip Selection: Valerie Mok

Nowadays, the living standard of Hong Kong people rise, and they live luxuriously. On the other hand, it leads to the serious pollution in Hong Kong. There are many types of pollution such as sound and water pollution. And air pollution is the main type of pollution.

The air pollutants lower the visibility. We even can't see through the Victoria Harbour. The heavy transports produce many greenhouse gases such as sulphur dioxide and nitrogen oxide. The toxic gases even suffocate us. It will affect our health very much and lead to respiratory illnesses. During the hot Summer, we love turning on air conditioners. Although it makes us feel better, it produces many harmful gases.

There is also water pollution in Hong Kong. The polluted water mainly comes from the restaurants since they have to wash a lot of dirty dishes.

Last but not least, there is also sound pollution. Due to the high technology, we have televisions everywhere, even on the street! But it produces a lot of unwanted noise for us. Also, there are construction sites and these even worsen the problem.

Can you hear? Very noisy!!!

There are many ways to protect the environment. For example, we can turn the air conditioner to 25° Celsius.

The government also proposed that we reduce roadside emissions. It is suggested that the drivers should turn off the engines when they stopped. Also, the drivers should use some environmentally friendly petroleum, such as the environmental diesel. We can use public transport such as the bus, railway, and ferry. Moreover, if we grow some plants, this can balance the gases in the atmosphere.

The serious pollution is a global problem. We all have the responsibility to save the environment.
