Gifted Education at HGSS

The Three-tier Implementation Model for Gifted Education

About the class

Subject	Chemistry (EMI)
Level	Secondary 4
Class size	32 students
Composition	~1/4 studied IS(Chem) in CMI in S3
Learning diversity	(1) Adaptation to using EMI in learning (2) More able students
Lesson time	6 lessons/ week; 25 mins/ lesson (half-day) (1 more lesson from this school year)

Lesson planning

Subject	Chemistry (EMI)
Level	Secondary 4
Topic	Unit 2 Atmosphere: Candle Investigations
Duration	1 hour (double lesson)
Date of the lesson try-out	30 November 2021
Learning Objectives	<p><u>Knowledge</u></p> <ul style="list-style-type: none">- To apply factors affecting the combustion of candle wax in an unfamiliar condition. <p><u>Skill</u></p> <ul style="list-style-type: none">- To analyse and interpret experimental data and form a justified claim.- To evaluate and revise hypotheses based on new empirical findings. <p><u>Attitude</u></p> <ul style="list-style-type: none">- To appreciate the nature of scientific inquiry and discovery.

Lesson planning

Prior knowledge of students	(1) Composition of air (2) Tests for oxygen and carbon dioxide (3) Conditions required for burning (4) Word equation of burning fuel
Highlights of the lesson design	Cooperative learning (experts groupings & jigsaw groupings) and construction of evidence card which helps nurture the creativity and higher-order thinking skills of gifted/more able students
Differentiation Strategies employed	(1) Tiered assignment (2) Learning stations

Lesson planning

Engage students by setting the scene

Part 1 – The Experiment of 3 Candles

Revising basic concepts from junior Science:

- conditions for burning
- fuel / hydrocarbon
- word equation

S4 Chemistry
Chapter 2 – The atmosphere
Experiment Worksheet

Name: _____ () Class: 4 _____ Date: _____

Part 1 – The experiment of three burning candles

1. What are the THREE essential conditions for burning?

_____, _____ and _____

2. Complete the word equation for complete combustion (burning).

fuel + oxygen → _____ + _____

Refer to the experiment of three burning candles below and predict which candle(s) will go off first.

3. Which candle(s) will go off first?

- A. Candle A
- B. Candle B
- C. Candle C
- D. The three candles go out at the same time

4. Explain your answer to question 3.

Making a prediction:
Students' answers:

A: 2

B: 0

C: 0

D: most students

Lesson planning

Setting the scene

- **Part 1 – The Experiment of 3 Candles**

Now, your teacher will show you a video of the experiment of three burning candles.

5. In the video, which candle(s) went off first? How much time did it take for it/them to go off?

Does the experimental result agree with your prediction in questions 3 and 4?

Students' answers:
Oxygen was used up

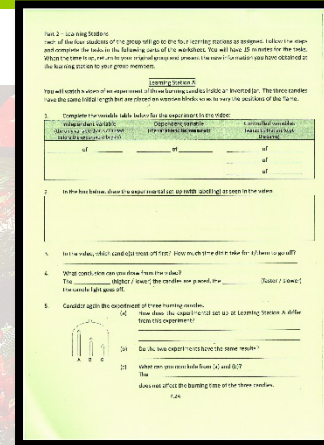

Why does the longest candle go out first?

Lesson planning

Design of tiered assignments – Learning Station A

- **Part 2 – The 4 Learning Stations**
- **Task(s):**
 - To investigate the relationship between the height of candles and the burning time of candles
- **Expected outcome:**
 - To complete a variable table
 - To draw the experimental set-up
 - To compare the similarities/differences between the two experiments
 - To come to the conclusion that “the length of candles does not affect the burning time of the three candles”

A	A
A	A

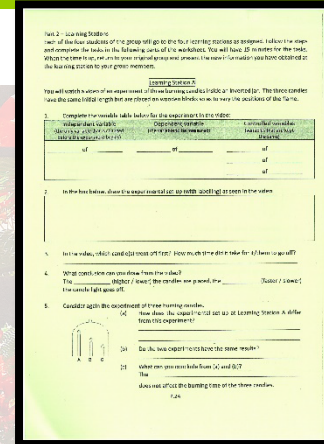

Lesson planning

Design of tiered assignments – Learning Station A

- Part 2 – The 4 Learning Stations
- Students' works:

A	A
A	A

1. Complete the variable table below for the experiment in the video:

Independent variable (the only variable that is changed before the experiment begins)	Dependent variable (the variable to be measured)	Controlled variables (variables that are kept the same)
height of candle	time of candles goes out	length of candle brand of candle size of jar

2. In the box below, draw the experimental set-up (with labelling) as seen in the video.

3. In the video, which candle(s) went off first? How much time did it take for it/them to go off?
Candle A, 20 seconds

4. What conclusion can you draw from the video?
The higher (higher / lower) the candles are placed, the faster (faster / slower) the candle light goes off.

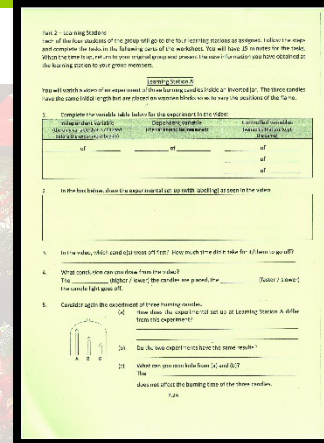

- able to complete variable table
- incomplete drawing
- able to draw conclusion from video

Lesson planning

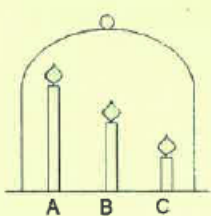

Design of tiered assignments – Learning Station A

- Part 2 – The 4 Learning Stations
- Students' works:

A	A
A	A

5. Consider again the experiment of three burning candles.

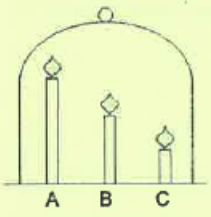

(a) How does the experimental set-up at Learning Station A differ from this experiment?
There is no wooden blocks place under the candle, the length of candle are the same.

(b) Do the two experiments have the same results?
Yes.

(c) What can you conclude from (a) and (b)?
 The length of candle does not affect the burning time of the three candles.

5. Consider again the experiment of three burning candles.

(a) How does the experimental set-up at Learning Station A differ from this experiment?
The bottom of the candle is replaced to steps instead of the candle.

(b) Do the two experiments have the same results?
Yes

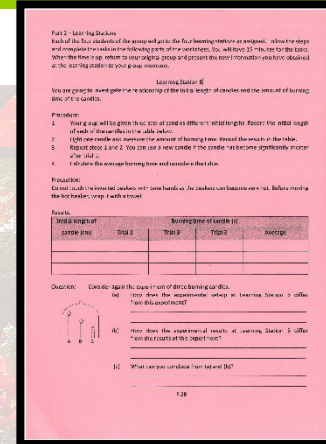

(c) What can you conclude from (a) and (b)?
 The length of the candle does not affect the burning time of the three candles.

- most were able to express ideas effectively
- (drawing of set-up could help the weaker ones)
- all were able to compare the two experiments and draw conclusion

Lesson planning

Design of tiered assignments – Learning Station B

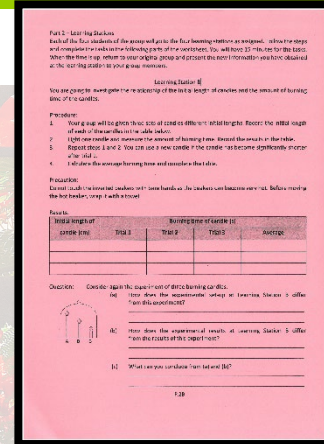

- **Part 2 – The 4 Learning Stations**
- **Task(s):**
 - To investigate the relationship between the initial length of candles and the burning time of candles
- **Expected outcome:**
 - To complete a mini experiment
 - To compare the similarities/differences between the two experiments
 - To come to the conclusion that “the length of candles does not affect the burning time of the three candles”

Lesson planning

Design of tiered assignments – Learning Station B

- Part 2 – The 4 Learning Stations
- Students' works:

Results:

Initial length of candle (cm)	Burning time of candle (s)			
	Trial 1	Trial 2	Trial 3	Average
4 ✓	23	23.4	21.23.3	22.5
6 ✓	15	large discrepancy 28.8	23.3	22.4
8.5 ✓	15.5	23.8	11.25	16.9 ✓

- discrepancy between some sets of data
- source of errors: CO₂ accumulated in beaker

- Remedy:
- showing video of the experiment

Lesson planning

Design of tiered assignments – Learning Station B

- Part 2 – The 4 Learning Stations
- Students' works:

B	B
B	B

- (a) How does the experimental set-up at Learning Station B differ from this experiment?
In this experiment, the three candles are covered at the same time in the same beaker while at learning station B the candles are covered by a beaker separately.
- (b) How does the experimental results at Learning Station B differ from the results of this experiment?
In this experiment, candle A will goes out first. However, in learning station B, all the candles will goes out almost at the same time..
- (c) What can you conclude from (a) and (b)?
The candles will goes out at the same time if they burn separately.

- (a) How does the experimental set-up at Learning Station B differ from this experiment?
Station B set-up is one candle one jar but the experimental set-up are three candles in one jar.
- (b) How does the experimental results at Learning Station B differ from the results of this experiment?
In the station B experiment, three candles go out almost at the same time.
- (c) What can you conclude from (a) and (b)?
The lengths of the candles is not the reason for the different duration of burning.

- all were able to express ideas with some details
- all were able to compare the two experiments and draw conclusion

Part 2: Tiered Assignments

Read the four versions of the essay and go to the four learning stations as assigned. Write the steps and complete the tasks in the following order of the worksheets. Try to finish 30 min for the Essay. When finishing step, when to your table group and discuss the essay (reasonable question allowed at the end of the class).

You are going to have to give the measurements of the mass of candles and the mass of burning time of candles.

Procedure

1. Your group will be given this piece of card to follow. Follow the steps right at each of the four stations in the table below.
2. Light one candle and measure the amount of burning time. Record the amount in the table.
3. Repeat steps 1 & 2. You can use a new candle if the candle has become significantly shorter than the last.
4. Calculate the average burning time and record in the table.

Precautions

Do not touch the candle when you have finished. Do not touch the beaker when you have finished. Do not touch the beaker when you have finished.

Results

Burning time	Average burning time (s)			Average
	Trial 1	Trial 2	Trial 3	

Conclusion

Check again the steps of the procedure. Do you have the appropriate safety precautions? Write the answer in the table below.

Q1: How does the experimental results of Learning Station B differ from the results of this experiment?

Q2: What can you conclude from (a) and (b)?

1/20

Lesson planning

Design of tiered assignments – Learning Station C

- **Part 2 – The 4 Learning Stations**

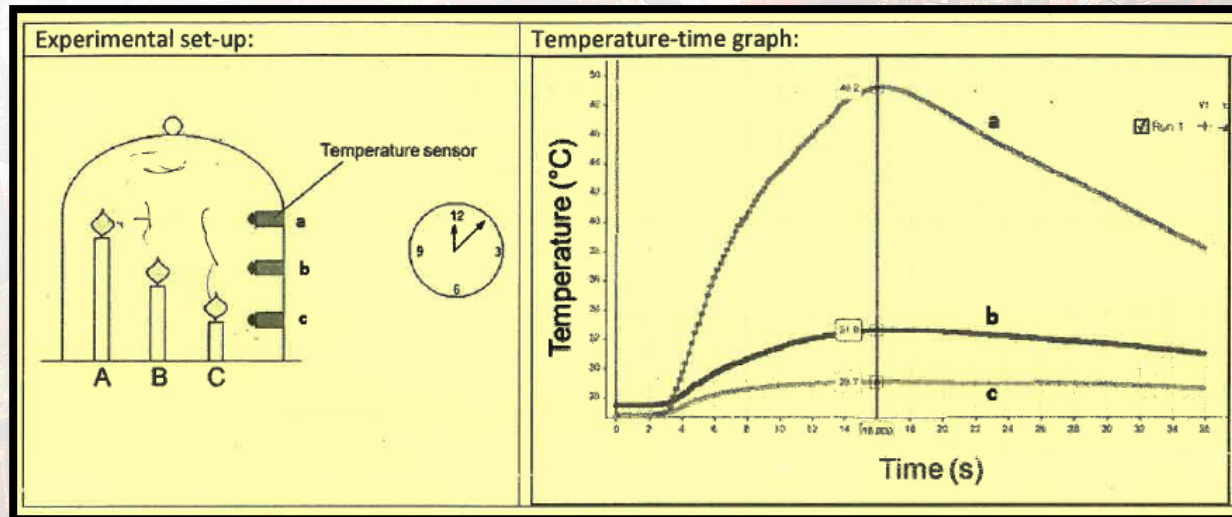

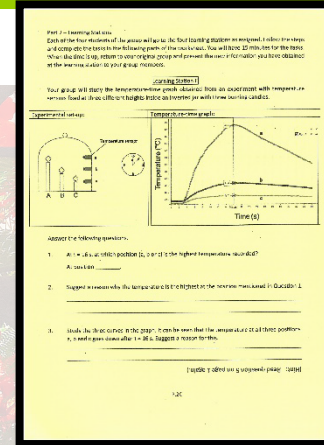

C	C
C	C

- **Task(s):**

- To interpret the temperature-time graph from the experiment

- **Expected outcome:**

- To realise the temperature of the upper part of the inverted jar was higher than that of the lower part
- To deduce that hot gas rose to the upper part of the jar
- To, possibly, deduce that the upper part of the jar had a higher amount (concentration) of CO₂ during the burning of the candles

Lesson planning

Design of tiered assignments – Learning Station C

- Part 2 – The 4 Learning Stations
- Students' works:

C	C
C	C

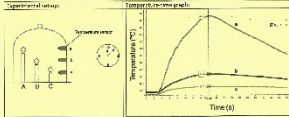

Part 2 – Learning Station C

Explain the hot air rises and the cooler air goes down. You will have 20 mins for the lesson. When the lesson ends, please leave the room and go to the next station. You will have 20 mins for the lesson.

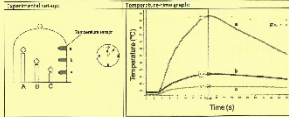

Learning Station C

You will start the lesson with the graph. You will have 20 mins for the lesson. You will have 20 mins for the lesson.

Experimental setup:

Graph of temperature vs. time:

Answer the following questions:

1. In the graph, the temperature is the highest at the position mentioned in Question 1.
A. sensor _____
2. Suggest a reason why the temperature is the highest at the position mentioned in Question 1.

3. Look at the graph in the graph. It shows that the temperature at all three positions is the same after 10 mins. Suggest a reason for this.

Copyright © 2015 by Pearson Education, Inc. All rights reserved. Printed in the United States of America.

2. Suggest a reason why the temperature is the highest at the position mentioned in Question 1.
Hot air rises, carbon dioxide rises.

2. Suggest a reason why the temperature is the highest at the position mentioned in Question 1.
Hot carbon dioxide rises due to convection. The top of temperature sensor is higher.

2. Suggest a reason why the temperature is the highest at the position mentioned in Question 1.
Because carbon dioxide goes up, and the cooler air goes down, so it will occur convection so the a part will have the most highest temp.

- all were able to explain the graph with their prior knowledge that hot air rises

Lesson planning

Design of tiered assignments – Learning Station C

- Part 2 – The 4 Learning Stations
- Students' works:

C	C
C	C

Part 2 - Temperature sensor

Explain the behaviour of the sensor after the first 16 s. The first 16 s of the graph are explained in video. Explain the decrease of the temperature in the following part of the graph. You will have 20 min. Use the hint. What is the hint? Hint: Read question 5 on page 1 again. Read the video and the diagram of the sensor and the graph.

Graph (Station C)

You should study the temperature sensor. Use an experiment with temperature sensor. You will have 20 min. Use the hint. What is the hint? Hint: Read question 5 on page 1 again. Read the video and the diagram of the sensor and the graph.

Temperature (°C)

Time (s)

Explain the following question:

1. At $t = 16$ s, the temperature at all three positions is at its highest. Suggest a reason for this.
2. Suggest a reason why the temperature at all three positions decreases after $t = 16$ s. Suggest a reason for this.

Hint: Read question 5 on page 1 again.

3. Study the three curves in the graph. It can be seen that the temperature at all three positions a, b and c goes down after $t = 16$ s. Suggest a reason for this.

Carbon dioxide sink, therefore, the density is higher than other common gases in air.

- upon highlighting the role of CO₂ in this experiment, a few students managed to retrieve their prior knowledge of density of the gas, which would help explaining the results from Learning Station D

3. Study the three curves in the graph. It can be seen that the temperature at all three positions a, b and c goes down after $t = 16$ s. Suggest a reason for this.

When candle starts burn, hot carbon dioxide rise up, and cold carbon dioxide go down and it form convection in bases position A is highest. The curve of candle go down fast, and candle A went off in 20 sec, because no oxygen gas inside the jar.

- a few students tried to explain the experimental results with lack of O₂

- yet, this can only be proven/ disproved in another experiment

Lesson planning

Design of tiered assignments – Learning Station D

- **Part 2 – The 4 Learning Stations**

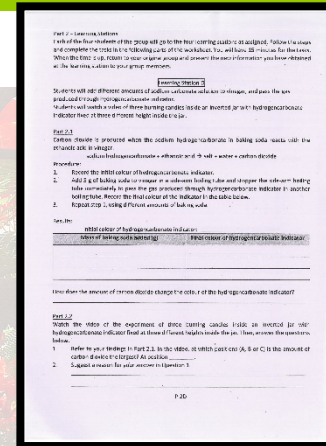

D	D
D	D

- **Task(s):**

- To find out the colour change of hydrogencarbonate indicator at different concentration of CO_2
- To find out the concentration of CO_2 at different positions of the inverted gas jar

- **Expected outcome:**

- To complete a mini experiment
- To realise that more CO_2 is produced when a larger mass of baking soda is used (Note: Students have not yet learnt reacting masses.)
- To deduce that the upper part of the jar had a higher amount (concentration) of CO_2 during the burning of the candles

Lesson planning

Design of tiered assignments – Learning Station D

Bottle cap filled with hydrogencarbonate indicator

D	D
D	D

Part 1: Learning Station

A set of four members of the group will go to the Learning Station assigned. You will then complete the tasks in the following table of the worksheet. You will have 20 minutes for this task. When the time is up, return to your original position at the start of the station and have observed at the Learning Station by your member.

Learning Station D

Students will add different amounts of sodium hydroxide solution to the jar, and pass the jar around through the group members. Information is given and used to make a table of these burning candles inside or outside of the hydrogencarbonate indicator that is three different heights in a jar.

Part 2

Students are prepared with the sodium hydroxide solution in boiling tubes with the indicator in a beaker.

Procedure:

- Record the initial colour of the hydrogencarbonate indicator.
- Add 2 g of boiling tube or more in a sodium hydroxide solution and stopper the sodium hydroxide tube immediately. In each jar pass the jar through the hydrogencarbonate indicator in a beaker. Record the final colour of the indicator in the table below.
- Repeat step 1 using different amounts of sodium hydroxide.

Table:

Initial colour of the hydrogencarbonate indicator	Final colour of the hydrogencarbonate indicator

How does the amount of sodium hydroxide change the colour of the hydrogencarbonate indicator?

Part 3

When the time of the experiment of three burning candles inside is over, the students will observe the colour of the indicator in the beaker. They observe the colour of the indicator in the beaker.

- Refer to your findings in Part 2. In the table, it will be clear that A, B or C is the amount of carbon dioxide that is produced.
- Repeat the experiment for each member of the group.

Lesson planning

Design of tiered assignments – Learning Station D

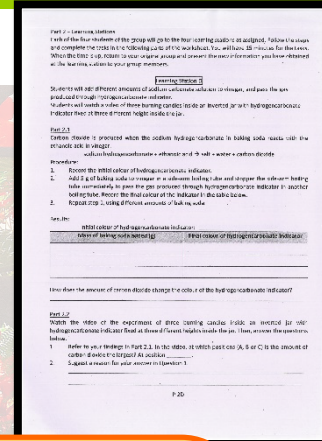

- Part 2 – The 4 Learning Stations
- Students' works:

D	D
D	D

1. Refer to your findings in Part 2.1. In the video, at which positions (A, B or C) is the amount of carbon dioxide the largest? At position A.

2. Suggest a reason for your answer in Question 1.

The colour of the hydrogen carbonate indicator of A is the palest in 3. of them, that shows position A have the largest amount P.2D of carbon dioxide.

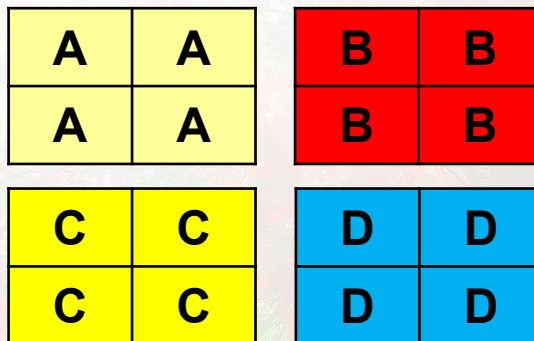

- all were able to point out the different amount (concentration) of CO₂ at different positions of the inverted jar

Lesson planning

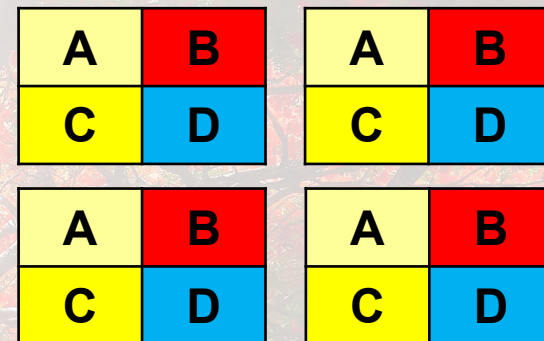

Design of tiered assignments – Cooperative Learning

- **Part 3 – Presenting New Information, completing Evidence Card and Reasoning**
- **Tasks:**
 - To report discussion results / experiment findings back in original groups
 - To complete the evidence card
 - To explain the experimental results of the 3 burning candles with the help of the evidence card

Expert groups

Jigsaw groups

- Students of different expert groups had the chance to share their findings to other students
- Discussion was not dominated by certain students

Lesson planning

Design of tiered assignments – Cooperative Learning

- Part 3 – Presenting New Information, completing Evidence Card and Reasoning
- Students' works:

Learning Stations (with student's name)	Findings / New information from the Learning Stations
A ([redacted])	The higher the candles are placed, the faster the candle light goes off. The (only) independent variable (what is it to be changed?) is the position of the flames. → The burning time is not affected by the length of candles (but the position) ✓
B ([redacted])	Different length of candle take different time to go out. When the 2 candles are put in separate beakers, the flames go off at the same time → the length of the candle is not the reason for the different duration of burning ✓
C ([redacted])	When the candle start burning hot CO ₂ rise up, cold CO ₂ go down and hot CO ₂ turn up and form convection and it will be no oxygen inside the jar. Hot air (carbon dioxide) goes up → carbon dioxide: higher density than other common gas in air ✓ carbon dioxide sinks (A → B → C)
D ([redacted])	The colour of the hydrogencarbonate indicator at position A is the palest, that's mean there are more carbon dioxide at position A ✓

- More able students helped the others to refine the presentation of their ideas

Lesson planning

Design of tiered assignments – Cooperative Learning

- **Part 3 – Presenting New Information, completing Evidence Card and Reasoning**
- **Students' works:**

<u>Evidence Card</u>		
The burning time is not affected by the length of candles. 	The length of the candle is not the reason for the different duration of burning. 	Carbon dioxide have higher density than other common gas in air. 
Independent variable is the factor that is set to be different before the experiment starts. (Given)	More carbon dioxide is at the higher position. 	Controlled variables are factors that are kept the same in the experiment. (Given)
Fire triangle: Oxygen, fuel, high temperature	Carbon dioxide puts out fire. (Given) 	Air contains 21% of oxygen. (Given)

Relevant evidence was chosen to explain the phenomenon

Lesson planning

Design of tiered assignments – Cooperative Learning

- **Part 3 – Presenting New Information, completing Evidence Card and Reasoning**
- **Students' works:**

Since carbon dioxide get a higher density than other common gas in air, it sinks when candles are burning while hot air goes up. Therefore, the highest candle - Candle A went off first.

Three burning candles are releasing hot carbon dioxide together, hot air rises therefore carbon dioxide goes to the top, when it gradually cools down, its density is higher than oxygen, therefore sinks. In a result, the uppermost candle goes out first, the lowest candle finally goes out.

with the help of the completed Evidence Card
Burning candles produce carbon dioxide, carbon dioxide raises to the top of the bell jar so that there are more carbon dioxide at higher position. Carbon dioxide puts out fire so the Candle A with a largest height went off first in the experiment.

After the lessons...

- **Teacher's observations:**

Students' higher-order thinking skills and communication skills were nurtured

By infusing several GE elements, all students had the opportunity of receiving gifted education

Students were provided with the chance to solve a Chemistry problem in an unfamiliar situation

All students were engaged in the learning tasks throughout the lessons

Students at all 4 Learning Stations completed their tasks more or less at the same time

More able students, in particular, enjoyed the challenging tasks

- **Students' feedback:**

Group D students liked the tasks and discussion

Group C students wanted to conduct experiments as well

Thank you!
